

Rashed Al-Qatarneh

Software Development Engineer · Payments & Infrastructure · Amazon

Jordan, Amman · rashedhaitham188@gmail.com · +962770349973 · [LinkedIn](#)

Summary

Software Development Engineer at Amazon with expertise in Java, Spring, and AWS, building and owning payment processor integrations that serve millions of customers across different markets. Specializes in distributed systems and its high-availability, AI-powered developer tooling, and cloud infrastructure, AWS Certified Cloud Practitioner and AWS Certified AI Practitioner.

Experience

Amazon | Software Development Engineer *Jun 2025 – Present*

- Owned the full transaction lifecycle authorization, capture, refund, and verification across three major global payment processors serving millions of customers in 6+ emerging markets, acting as the single technical owner of all processor integrations end-to-end.
- Resolved a years-long stuck workflow problem on the most complex payment processor integration, tracing what appeared to be processor infrastructure failures to an issuer-side 3DS authentication defect returning empty redirect URLs, fixing 3 code-level bugs: refunded events silently ignored on DynamoDB mapping expiry, 24-hour auto-approve failing due to stale cache reads, and late failure events skipped after premature auto-approval, driving cross-team coordination to unblock refund processing stuck for over a month, with stuck workflow counts dropping measurably across the payment pipeline.
- Designed and implemented a real-time payment availability monitoring system that tracks processor health per operation type, detects partner outages automatically via custom detection algorithms, and fires team alerts before customer-facing degradation occurs, closing a critical observability gap across multiple payment services.
- Built PAIA (Payment AI Integration Authority), an internal platform that automates payment processor integration onboarding end-to-end, covering requirements gathering, TPS configuration, infrastructure provisioning, and code generation across 16 compliance domains. Extended the platform with an AI-powered in-wizard chatbot that loads full workflow context per step, streams real-time guidance, and supports quick-start prompts for step validation and consistency checks, eliminating manual compliance review and reducing processor onboarding from weeks to days.
- Migrated remittance and chargeback file processing to a standardized SFTP-based platform, onboarding a new marketplace with zero processing downtime by deploying AWS CDK infrastructure (TypeScript) across 21 configuration files hardened with SecureCDK security blueprints, establishing secure partner connectivity via SSH key authentication and IP allowlisting, and uncovering a cross-environment alarm isolation defect silently generating false production alerts across 6 existing Middle East banking partners.
- Built a full-stack serverless performance dashboard from scratch, React frontend, AWS Lambda backend, API Gateway with JWT authentication, that auto-generates monthly and quarterly reports for leadership, eliminating hours of manual data collection per reporting cycle.

Bank Al-Bilad (outsourcing) | Java Developer *Jan 2025 – Jun 2025*

- Built a Customer Request Service enabling clients to submit and track requests with an admin management layer, implementing JWT authentication, LDAP login, and route access control by Channel ID and Client Version to meet strict banking security requirements.
- Designed RESTful APIs with role-based access control (RBAC), applying SOLID principles and design patterns (Factory, Singleton, Strategy) to deliver a maintainable, production-grade service in a regulated financial environment.

Inspire for Solutions Development | Java Developer *Sep 2024 – Jun 2025*

- Designed and built a scalable microservices banking application using Spring Boot, Kafka for async inter-service messaging, GraphQL for flexible data fetching, and the Saga pattern for distributed transaction reliability, deployed via Docker.

- Implemented end-to-end observability using Prometheus for real-time metrics and Zipkin for distributed tracing, and enforced fine-grained authentication via Keycloak with role-based access control across all services.

Education

University of Jordan — B.Sc. in Computer Science 2020 – 2024 · GPA: Very Good

Manara Problem Solving Program, Solved 250+ LeetCode problems.

Skills

Languages: Java, TypeScript, SQL

Frameworks & Libraries: Spring Boot, Spring Security, Spring Cloud, React, GraphQL

Cloud & Infrastructure: AWS (Lambda, API Gateway, DynamoDB, CDK, S3, SQS, Step Functions, EventBridge, AppConfig, Transfer Family, SNS, Cross-account IAM), Docker

Messaging & Streaming: Kafka, SFTP, Event Streams

Security & Auth: JWT, LDAP, Keycloak, RBAC, OAuth2, SSH, SecureCDK, GuardDuty

Observability: Prometheus, Zipkin, CloudWatch, Distributed Tracing

Databases: MySQL, PostgreSQL, DynamoDB, NoSQL

Tools & Practices: Git, REST APIs, Microservices, SOLID, Design Patterns, CI/CD, MCP, Agile/Scrum

Languages

Arabic (native) · English (professional) · Russian (intermediate)
